

 Built using Tableau on the DataCo Smart Supply Chain dataset (Kaggle)

THE ONE-DAY PROMISE ...

**A CASE OF A SUPPLY CHAIN PROBLEM
THAT WASN'T REALLY A SUPPLY CHAIN PROBLEM.**

Every order leaves with two dates.
One is the day it actually arrives.
The other is the day the business promised it would.

This project began with a simple question:

- What happens when those two slowly stop matching?

57.29% **OF ORDERS IN THIS
NETWORK SHIP LATE.**

- Region shows a mild pattern.
Category shows a mild pattern.
- Shipping mode doesn't.

First Class: 100% late.

Standard Class: 39.77% late.

The tier nobody pays extra for is the only one keeping its word.

**THE EASY EXPLANATION:
FIRST CLASS SHIPPING IS JUST WORSE.
IT'S NOT!**

- Promised 1 day. Delivered in 2. Every time.
- Promised 2 days. Delivered in nearly 4.
- Promised 4 days. Delivered in 3.996.

Nothing got worse operationally.

**ONE PROMISE STAYED HONEST.
TWO NEVER WERE.**

WHAT DOES AN UNKEPT PROMISE COST...

\$26,955

Quietly given up

Small enough to hide in a quarterly deck.
Real enough to be worth fixing.

**Profit Ratio
On-time:**

12.25%

**Profit Ratio
Late Orders:**

11.76%

A Promise That Was Never Recalibrated!

First Class shipping promises 1 day, delivers in 2, every single time. It's quietly costing profit, and the fix costs nothing!

Region vs Late

Category vs Late

Shipping Mode vs Late

Profit Impact by Mode

0.49% gap x \$5.48M sales tied to late orders

Estimated \$26,955 in profit given up (modeled estimate) on Second Class alone, from a scheduling promise that's never been recalibrated.

Scheduled vs Actual by Mode

**JUST A NUMBER SOMEONE SET ONCE
AND NEVER CHECKED AGAIN.**

**No new warehouses.
No carrier renegotiation.**
